

STRONGKEY PILLAR #1: FIDO2 USER AUTHENTICATION

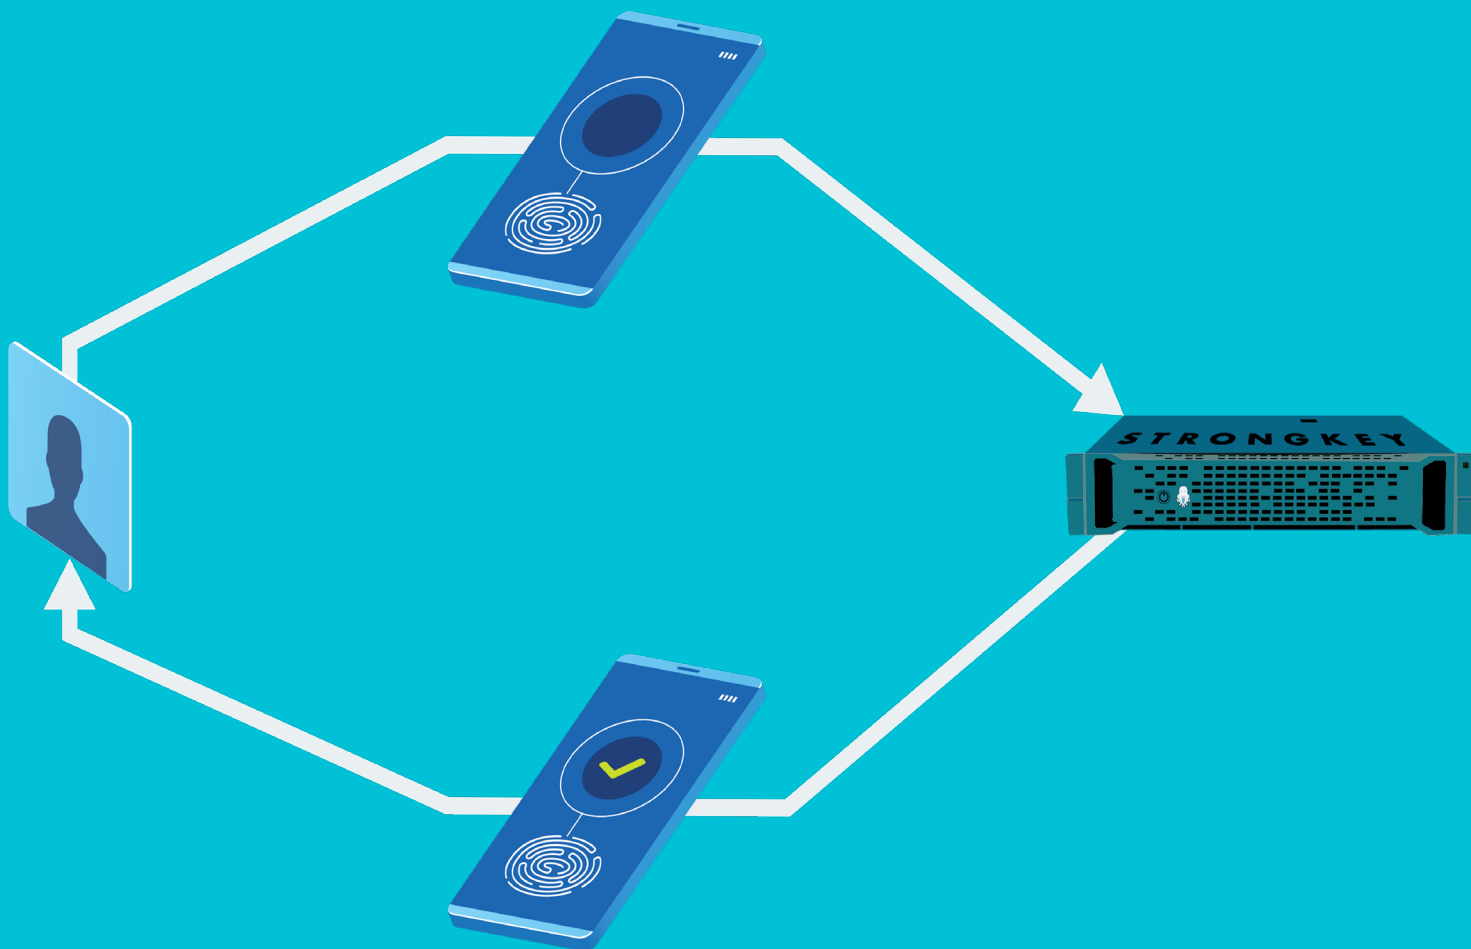

[STRONGKEY.COM](https://strongkey.com)

High Assurance Access to Protected Resources

Authentication with passwords are vulnerable to being stolen and require users to frequently change to prevent their accounts from being compromised.

With FIDO2, users can access web services with just their biometrics (i.e. fingerprint), which is more secure, private and convenient!

What Makes FIDO2 Authentication Better than Other Methods?

1. Security:

Tokenized biometrics (fingerprints) never leave the authentication device (Tellar), so login information cannot be stolen.

2. Privacy:

Unique login credentials are created for each website, so user data cannot be tracked across sites.

3. User Friendliness:

Your users will not need to frequently update their passwords, because there are no passwords at all!
